Introduction

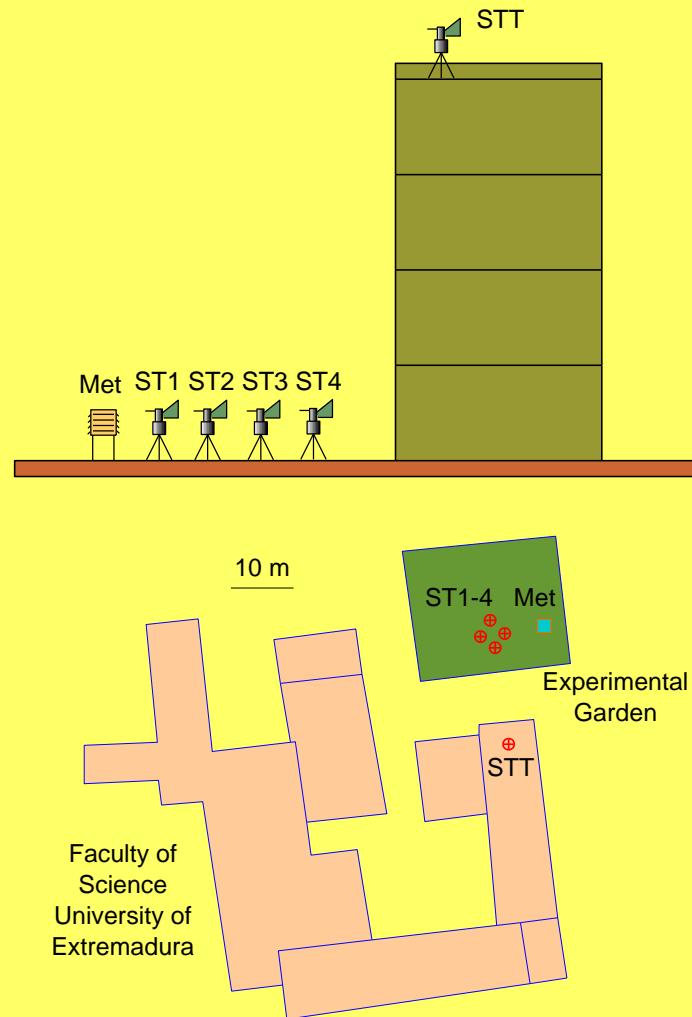

- Sampler comparisons usually done between different types of sampler
- Those comparison made with the aim to asses the most suitable type of sampler
- Comparisons using the same sampler usually comparing different places
- Variability inside the same type of sampler is needed to asses its accuracy

Objectives

- The aims is to evaluate variability inside the Hirst sampler Burkard seven-day
 - Daily variability
 - Hourly variability
- Comparisons made at the sample place
- To asses the spore traps used for Extremadura Aerobiological Network before put them in a definitive location

Material and methods

- 5 seven-day Burkard samplers at the same place
 - 1 sampler at 15 m over a terrace: STT
 - 4 samplers at ground level separated 2 m each other: ST1, ST2, ST3, ST4
 - At least 3 samplers at ground level were working simultaneously
 - 1 automatic meteorological station at ground level: Met

Samplers

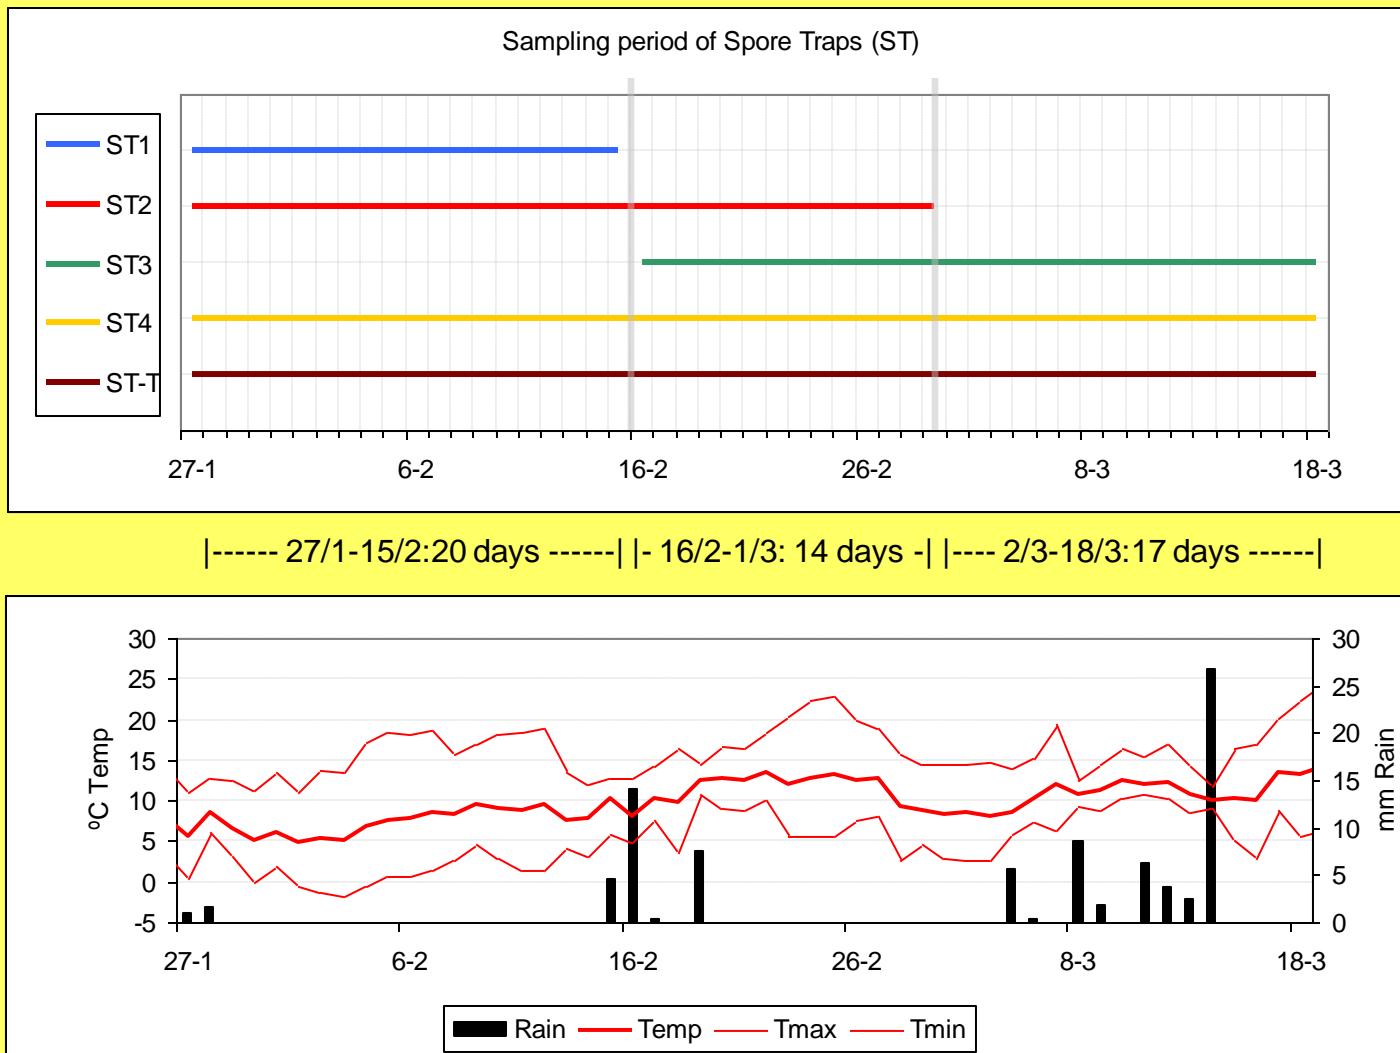

Meteorological station on the left and the four spore traps at the experimental garden on the right

Material and methods

- Place of sampling: Faculty of Science in Badajoz, University of Extremadura, Spain
- Time of sampling: 51 days
 - from 27th January to 18th March 2011
- Adhesive: White Petrolatum
 - petroleum jelly, soft paraffin, vaseline, CAS number 8009-03-8
- Four longitudinal scans at 400x LM magnification
- Spore traps were calibrated at the beginning of the sampling

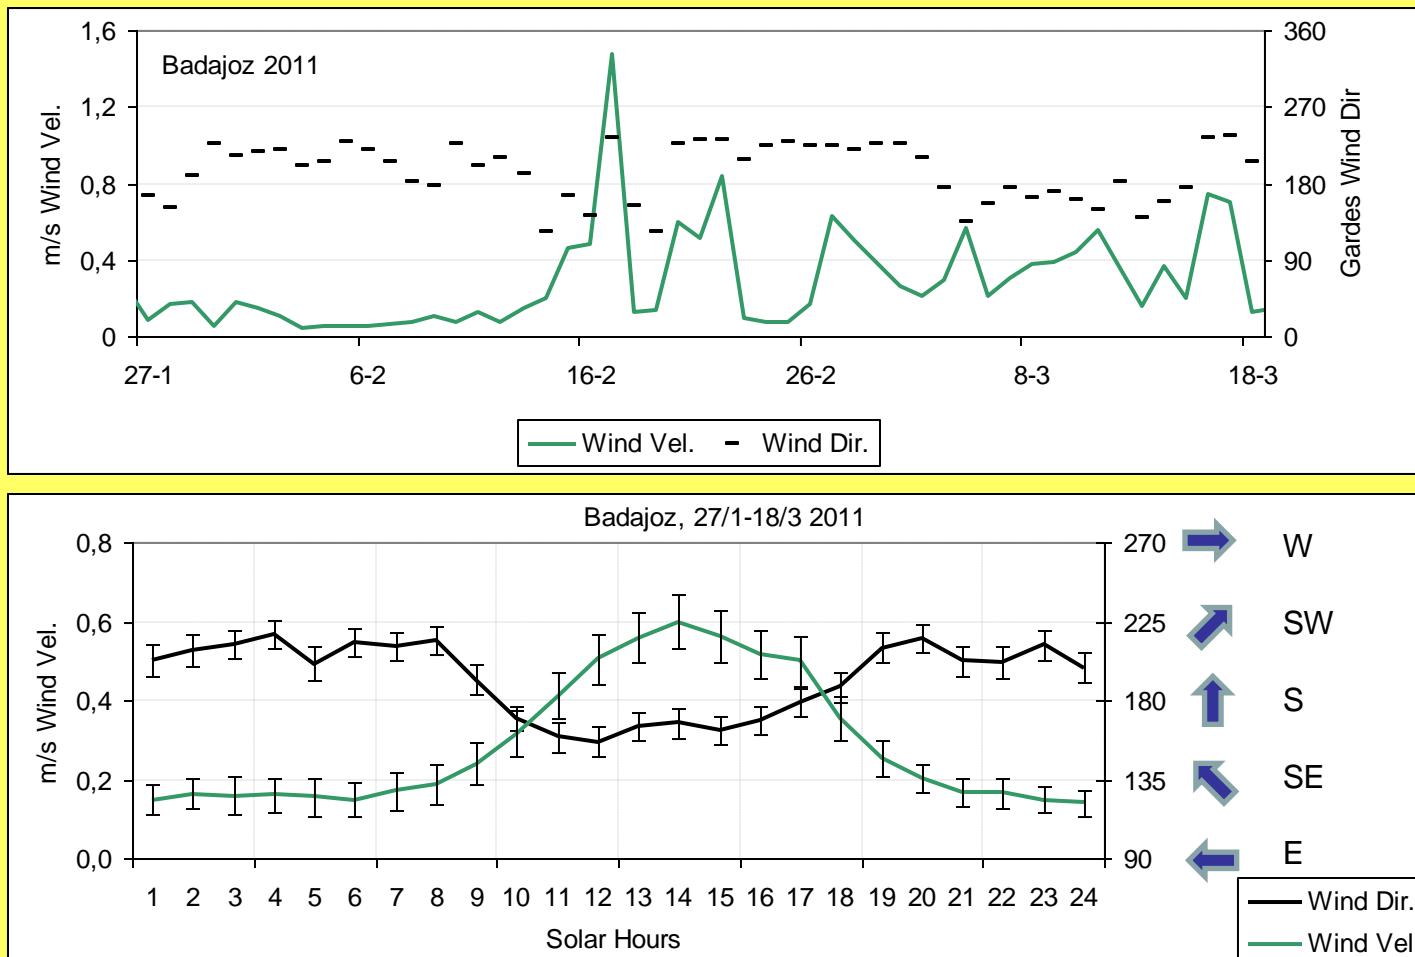

Period studied

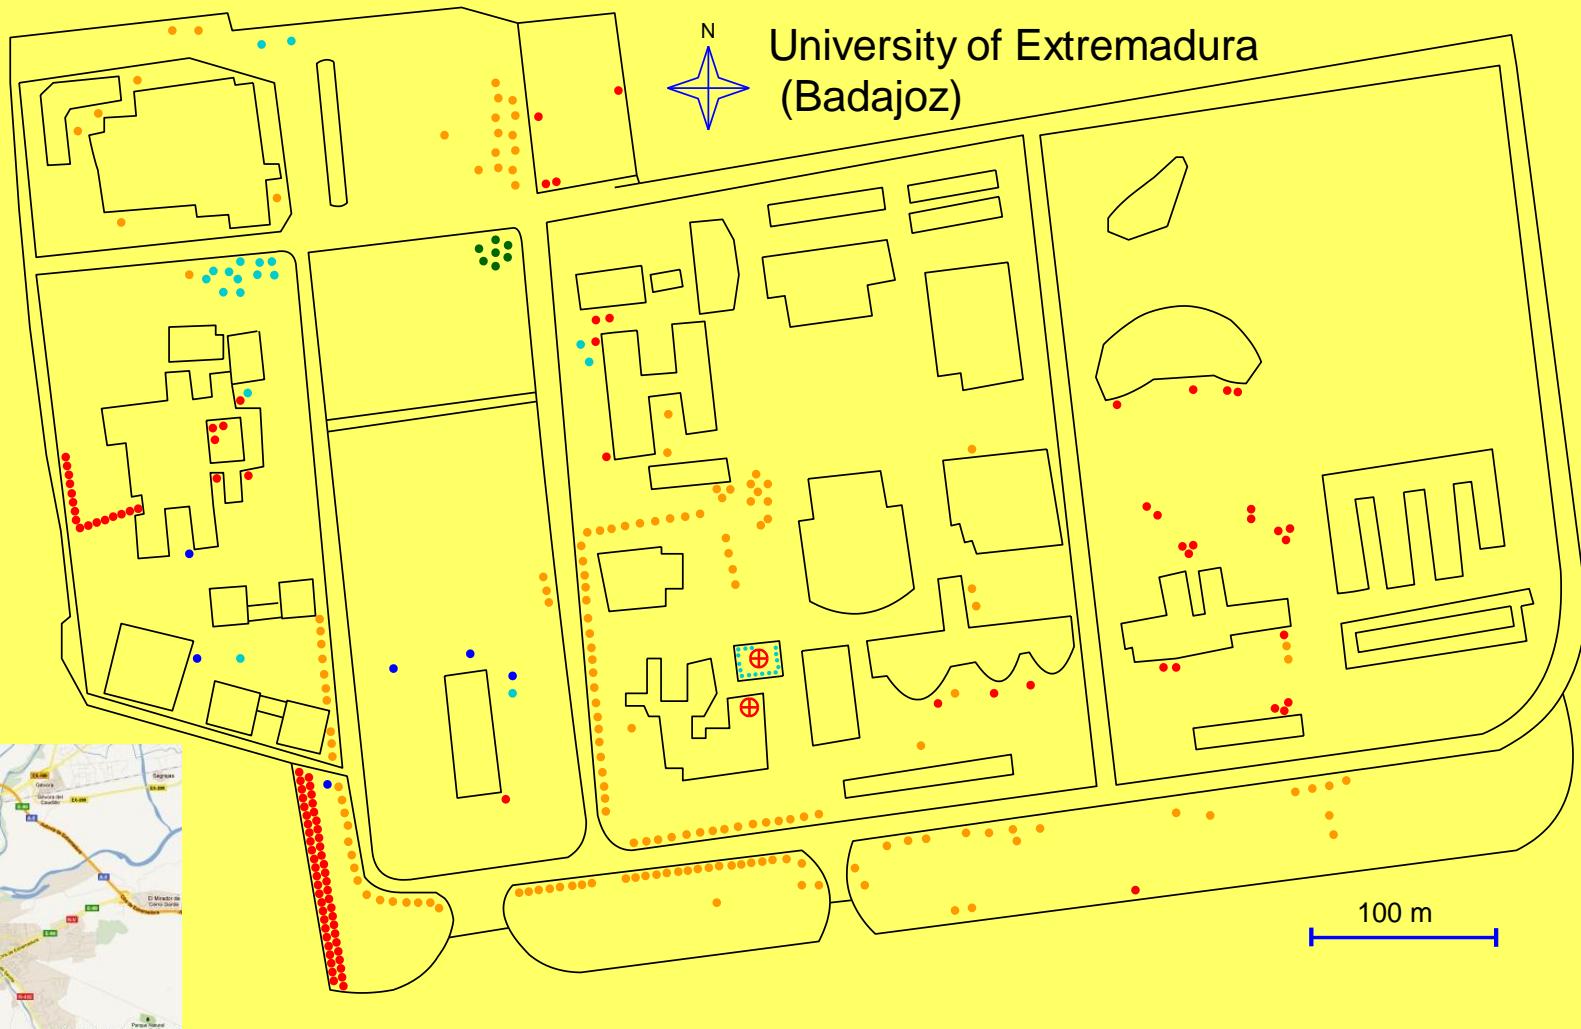

Sampling period studied and meteorology.

Conclusions

- There are no statistically significant differences among spore traps at ground level using daily data, nevertheless, with hourly data differences have been found.
- At 15 m height statistically significant differences in pollen capture have been observed.
- Hourly peaks concentration rarely have been recorded at the same time in all spore traps, differences up to 7 hours have been found.
- Pollen concentration at hourly peaks showed differences of double or triple among spore traps.
- Spatial distribution of pollen and spores is far from homogeneous even within two meters away.

Sampling comparison among Hirst spore traps of the same model
